

EXHIBIT B

MILESTONE

The following deliverables shall comprise the Milestone:

- 1) Functional specifications and software design document. This document provides an overall reference model of the Connector Framework (defines terms, etc.) and describes in detail the functionality of the wizard and the connector engine. Details use of third-party software.
- 2) Detailed plan for the development phase, including internal milestones.
- 3) Documentation of the connector file format.
- 4) Description of initial prototyping and testing efforts, including either screenshots or running test applications (these will most likely not be representative of the complete, final product, but will serve to test and explore individual aspects of the system). Will include explorations of the Wizard as well as the connector engine.
- 5) System integration guidelines. This will describe the system requirements for operating the Connector Framework, both in terms of how it will interface with pazpar2, and with the WCL administrative framework. Initial suggestions for hardware/software platform. This will be a working document, reflecting both feedback from OCLC and subsequent experience gained.
- 6) A description of the software test suite; specifically a description of the test systems being used to do regression, integration and system testing for each iteration of the components of the system.
